

Professional Personal Portfolio Website

Internship Task Report

Student Name: Ghulam Mohiyu Ud Din

Internship Domain: Web Development

Task Number: Task 1

Organization: Devixo Solutions

Email: ghulammohiyudin11@gmail.com

GitHub: github.com/GMD369

LinkedIn: linkedin.com/in/ghulam-mohiyu-ud-din

Date: July 2026

1. Objective

The objective of this task was to design and develop a modern, fully responsive personal portfolio website that showcases the student's profile, technical skills, projects, education, and contact information, using only HTML5 and CSS3 for structure and styling, with vanilla JavaScript for interactivity. No CSS frameworks such as Bootstrap or pre-built website templates were to be used. The website was required to include a navigation bar, hero section, skills and project cards, a contact form (UI only), a footer, smooth scrolling, hover animations, and a professional, consistent color theme, along with a bonus dark mode feature implemented purely with CSS.

2. Problem Statement

Students and early-career developers often lack a single, centralized, professional space where recruiters or collaborators can view their skills, education, and project history at a glance. Relying only on a PDF resume limits presentation, since a resume cannot demonstrate front-end skill, interactivity, or design sense the way a live website can. There was a need for a self-contained, lightweight, framework-free website that could be hosted anywhere, load quickly, work well on any device such as desktop, tablet, or mobile, and clearly communicate who the student is, what they can build, and how to get in touch, while the site itself also serves as a demonstration of the student's HTML and CSS ability.

3. Technologies Used

- HTML5
- CSS3 (Grid, Flexbox, Custom Properties)
- Vanilla JavaScript (ES6)
- IntersectionObserver API (scroll-reveal animations)
- localStorage API (dark mode persistence)
- Google Fonts – Inter
- Inline SVG icons (GitHub, LinkedIn)
- Git and GitHub for version control

No CSS frameworks such as Bootstrap and no pre-built templates were used, in line with the task requirements. Every layout, component, and animation was written from scratch.

4. Implementation Steps

1. **Planning the structure** – defined six pages (Home, About, Skills, Education, Projects, Contact) sharing a common navbar and footer, and planned the sections for each page.
2. **Building the design system** – created a single stylesheet, style.css, using CSS custom properties for colors, spacing, shadows, and border radius, so the whole site including dark mode could be re-themed from one place.
3. **Building the shared layout** – implemented a sticky navigation bar with a mobile hamburger menu, and a footer, repeated consistently across all six HTML pages.
4. **Building page content** – hero section on Home, biography and experience timeline on About, skill cards with progress bars on Skills, education timeline on Education, filterable project cards on Projects, and a contact information card with a form on Contact.
5. **Adding interactivity with JavaScript** – a dark and light theme toggle persisted with localStorage, scroll-reveal animations using IntersectionObserver, animated skill progress bars, project category filtering, and contact form feedback on submission.
6. **Personalizing content** – replaced placeholder text with real resume data, including education, work experience, and twelve real projects, along with GitHub and LinkedIn profile links.
7. **Making the site responsive** – added breakpoints at 960px, 720px, and 480px, collapsing grids to single columns, converting the navigation bar into a mobile hamburger menu, and fixing text overflow issues on small screens.
8. **Testing** – verified layout and interaction behaviour across desktop, tablet, and mobile screen widths directly in the browser before final delivery.

5. Code Screenshots with Explanations

5.1 CSS Custom Properties (style.css)

```
:root {
  --color-bg: #f8fafc;
  --color-primary: #4f46e5;
  --color-accent: #14b8a6;
  --radius-md: 14px;
  --transition: 0.25s ease;
}

[data-theme="dark"] {
  --color-bg: #0f1420;
  --color-primary: #818cf8;
}
```

This block defines the site's design tokens as CSS variables. Every color, spacing value, and transition throughout the site references these variables instead of hard-coded values, which is what allows the entire site – including dark mode – to be re-themed by editing just two small blocks of code.

5.2 Dark Mode Toggle (script.js)

```
const root = document.documentElement;
const themeToggle = document.getElementById('themeToggle');
const savedTheme = localStorage.getItem('theme');

if (savedTheme) {
  root.setAttribute('data-theme', savedTheme);
}

themeToggle?.addEventListener('click', () => {
  const current = root.getAttribute('data-theme') === 'dark' ? 'dark' :
  'light';
  const next = current === 'dark' ? 'light' : 'dark';
  root.setAttribute('data-theme', next);
  localStorage.setItem('theme', next);
});
```

This script reads the saved theme preference from localStorage on page load and applies it, then toggles between light and dark on click, saving the new preference so it persists across page reloads and across all six pages of the site.

5.3 Filterable Project Card (projects.html)

```
<div class="card project-card reveal" data-category="ai">
  <div class="project-thumb">
    
```

```
</div>
<div class="project-body">
  <h3>AI Knowledge Analyst Copilot</h3>
  <p>Full-stack RAG platform...</p>
</div>
</div>
```

Each project card carries a data-category attribute. A small JavaScript filter function reads this attribute to show or hide cards when a filter button (All, AI & SaaS, Web Apps, Desktop & Console) is clicked, without reloading the page.

5.4 Responsive Breakpoint (style.css)

```
@media (max-width: 720px) {
  .nav-menu {
    position: fixed;
    transform: translateY(-130%);
    transition: transform var(--transition);
  }
  .nav-menu.active { transform: translateY(0); }
  .grid-3, .grid-2 { grid-template-columns: 1fr; }
  .hero { text-align: center; }
}
```

At a 720px viewport width, the navigation menu becomes a full-width panel that slides down from the top when the hamburger icon is tapped, and multi-column grids collapse into a single column so content remains readable on mobile screens.

6. Output / Result Screenshots

6.1 Desktop View

Figure 6.1 – Home page hero section, showing the profile introduction, call-to-action buttons, and social links.

Figure 6.2 – Home page "What I Do" section shown in dark mode, highlighting Full-Stack Development, AI & RAG Systems, and Workflow Automation.

Figure 6.3 – About page, showing the profile photo, biography, and quick-info grid.

Figure 6.4 – About page experience timeline shown in dark mode, listing the internship at Nexium and the Teaching Assistant role at UET Lahore.

Figure 6.5 – Skills page, showing skill category cards with animated proficiency bars.

Figure 6.6 – Education page timeline shown in dark mode, listing the BS in Computer Science at UET Lahore and ICS at Punjab College.

Figure 6.7 – Projects page shown in dark mode, displaying filterable project cards with category filter buttons.

Figure 6.8 – Contact page shown in dark mode, with the contact information card and the UI-only contact form.

Figure 6.9 – Site footer shown in dark mode, with navigation links, contact email, and copyright notice.

6.2 Mobile / Responsive View

Figure 6.10 – Home page on a mobile viewport, showing the collapsed hamburger menu and stacked hero content.

Figure 6.11 – About page on mobile, showing the profile photo and biography stacked in a single column.

Figure 6.12 – Skills page on mobile, with skill cards stacked vertically for readability.

Figure 6.13 – Education page on mobile, with the timeline adapted to a narrower indent for small screens.

Figure 6.14 – Projects page on mobile, with project cards stacked in a single column.

Figure 6.15 – Contact page on mobile, confirming the contact card and form fields fit correctly with no horizontal overflow.

7. Challenges Faced

- **No CSS framework allowed** – building a fully responsive grid and flexbox layout system, including a mobile navigation menu and card grids, entirely by hand instead of using Bootstrap utility classes required writing and testing custom breakpoints at 960px, 720px, and 480px.
- **Repeating layout across six static pages** – with no templating engine available, the navigation bar and footer had to be kept manually consistent across all six HTML files whenever content changed.
- **Text overflow on small screens** – long content such as the full email address on the Contact page initially overflowed its container on narrow viewports; this was fixed by adding minimum width and word-wrap rules to the flex containers.
- **Mapping real project images** – matching each of the twelve real resume projects to the correct thumbnail image required careful cross-referencing, since filenames did not always match project names directly.
- **Consistent dark mode** – ensuring every component such as cards, forms, badges, and the timeline looked correct in both light and dark themes meant routing all colors through CSS variables rather than hard-coding any color values.
- **Mobile input zoom** – mobile Safari automatically zooms into form fields when the font size is under 16 pixels; this was fixed by explicitly setting the form input font size to 16 pixels.

8. Conclusion

This task was completed successfully, delivering a fully functional, six-page personal portfolio website built entirely with HTML5, CSS3, and vanilla JavaScript, with no external frameworks or templates used. All required features, including responsive design, a navigation bar, a hero section, skill and project cards, a UI-only contact form, a footer, smooth scrolling, and hover animations, were implemented, along with the bonus CSS-based dark mode. The site was populated with real personal and project data and verified across desktop, tablet, and mobile screen sizes. It is ready to be hosted on any static site host such as GitHub Pages, Netlify, or Vercel. This project reinforced core front-end fundamentals, including responsive layout techniques, CSS custom properties for theming, and vanilla JavaScript DOM interactivity, without depending on any external library.
